

# Assignment 5.2

## Problem Statement 1:

Using the following data, perform a oneway analysis of variance using  $\alpha=.05$ . Write up the results in APA format.

[Group1: 51, 45, 33, 45, 67]

[Group2: 23, 43, 23, 43, 45]

[Group3: 56, 76, 74, 87, 56]

## Solution

### Step 1: Define the Null and Alternate Hypotheses.

Null Hypothesis  $H_0$ :  $\text{Mean}(\text{Group1}) = \text{Mean}(\text{Group2}) = \text{Mean}(\text{Group3})$

Alternate Hypothesis  $H_1$ : Mean of all groups are not equal.

### Step 2: State the significance level (alpha).

Significance Level  $\alpha=.05$

### Step 3: Calculate degree of freedom.

Numbers in each group;  $n= 5$

Total numbers in all groups;  $N = 15$

Total levels;  $a = 3$

$df\text{-between} = a - 1 = 2$

$df\text{-within} = N - a = 15 - 3 = 12$

$df\text{-total} = N - 1 = 15 - 1 = 14$

**Step 4: State decision rule.**

To look up critical value, we need to use two different degree of freedom; df-between and df-within.

(2, 12)

If F is greater than 3.89, reject H0.

**Step 5: Calculate test statistics**

Sample means for the groups: = 48.2, 35.4, 69.8

Intermediate steps in calculating the group variance

[[1]]

value mean deviations sq deviations

|   |    |      |       |        |
|---|----|------|-------|--------|
| 1 | 51 | 48.2 | 2.8   | 7.84   |
| 2 | 45 | 48.2 | -3.2  | 10.24  |
| 3 | 33 | 48.2 | -15.2 | 231.04 |
| 4 | 45 | 48.2 | -3.2  | 10.24  |
| 5 | 67 | 48.2 | 18.8  | 353.44 |

[[2]]

value mean deviations sq deviations

|   |    |      |       |        |
|---|----|------|-------|--------|
| 1 | 23 | 35.4 | -12.4 | 153.76 |
| 2 | 43 | 35.4 | 7.6   | 57.76  |
| 3 | 23 | 35.4 | -12.4 | 153.76 |
| 4 | 43 | 35.4 | 7.6   | 57.76  |
| 5 | 45 | 35.4 | 9.6   | 92.16  |

[[3]]

value mean deviations sq deviations

|   |    |      |       |        |
|---|----|------|-------|--------|
| 1 | 56 | 69.8 | -13.8 | 190.44 |
|---|----|------|-------|--------|

|   |    |      |       |        |
|---|----|------|-------|--------|
| 2 | 76 | 69.8 | 6.2   | 38.44  |
| 3 | 74 | 69.8 | 4.2   | 17.64  |
| 4 | 87 | 69.8 | 17.2  | 295.84 |
| 5 | 56 | 69.8 | -13.8 | 190.44 |

Sum of squared deviations from the mean (SS) for the groups:

612.8   515.2   732.8

$$\text{Var1} = 612.8 / (5-1) = 153.2$$

$$\text{Var2} = 515.2 / (5-1) = 128.8$$

$$\text{Var3} = 732.8 / (5-1) = 183.2$$

$$\text{MSerror} = (153.2 + 128.8 + 183.2) / 3 = 155.07$$

Calculating the remaining error (or within) terms for the ANOVA table:

$$\text{dferror} = 15 - 3 = 12$$

$$\text{SSerror} = (155.07) (15 - 3) = 1860.8$$

Intermediate steps in calculating the variance of the sample means:

$$\text{Grand mean } (\bar{x} \text{ grand}) = 48.2 + 35.4 + 69.83 = 51.13 \quad 48.2 + 35.4 + 69.83 = 51.13$$

group mean   grand mean   deviations   sq deviations

|      |       |        |        |
|------|-------|--------|--------|
| 48.2 | 51.13 | -2.93  | 8.58   |
| 35.4 | 51.13 | -15.73 | 247.43 |
| 69.8 | 51.13 | 18.67  | 348.57 |

$$\text{Sum of squares (SSmeans)} = 604.58$$

$$\text{Varmeans} = 604.583 - 1 = 302.$$

$$\text{MSbetween} = (302.29)(3-1) = 1511.$$

Calculating the remaining between (or group) terms of the ANOVA table:

$$\text{dfgroups} = 3 - 1 = 2$$

$$\text{SSgroup} = (1511.45)(3-1) = 3022.$$

Test statistic and critical value

$$F=1511.45155.07=9.75$$

$$F_{\text{critical}}(2,12)=3.89$$

Decision: reject H0 Decision: reject H0

ANOVA table

| Source | SS     | df | MS      |
|--------|--------|----|---------|
| Group  | 3022.9 | 2  | 1511.45 |
| Error  | 1860.8 | 12 | 155.07  |
| Total  | 4883.7 |    |         |

Effect size

$$\eta^2=3022.94883.7=0.62$$

APA writeup

#### Step 5: State result

$$F(2, 12)=9.75, p < 0.05, \eta^2=0.62.$$

$$\chi^2 = 8.006$$

Result: Reject H0

#### Step 6: State conclusion

As  $8.006 > 7.81473$  It means, there is some relationship between gender and level of education.

We conclude that Gender and Education level are dependent,  $\chi^2 = 8.006$  ,  $p < 0.05$
